PERSONAL PROJECTS

Portfolio application using React :-

- Built portfolio application using React, featuring appealing animations. This portfolio showcases about myself and my skills, and includes a section dedicated to displaying my recent projects. Additionally, it offers a contact section that allows users to send messages directly to my email.
- In this project, I utilized React as my primary framework library and incorporated Tailwind CSS to style the application. Additionally, I employed various packages, including Framer Motion for all animations, React Hook Form for form validation, and React Anchor Link Smooth Scroll for smooth scrolling functionality.
- [github deployed](#)

E-commerce website using Java :-

- The goal of the project was to make E-commerce website using Java, HTML, CSS, JavaScript, JDBC, Servlet and JSP.
- In this project I made admin panel (which can add or remove items from the website) and a normal user who can simply login to the website, add their item in the cart and start shopping.
- With the help of Servlet we are capable of handling user request on the server side and generate dynamic response. And i also use JSP (Java Server Pages) to create dynamic web content.
- [github](#)

Bank account handling system using Java :-

- The goal of the project was to make a Java program which takes the input from the user, such as whether the user wants to deposit money, check account balance, withdraw money, see pervious transaction and perform tasks accordingly.
- [github](#)

Responsive blog template :-

- The goal of the project was to make responsive blog template using HTML and CSS.
- With the help of HTML tags and CSS properties i built an engaging and user-friendly responsive blog template.
